Desensitizing adhesive

What type of adhesive do you prefer?

Hanau, 21 July 2006 – **Adhesion without postoperative complaints for any bonding-type. Heraeus Kulzer has combined desensitizing and reliable bonding in its adhesive systems. In this way, the patient can be protected against postoperative hypersensitivity during each step of the bonding process.**

One in five adults has exposed tooth necks or sensitive teeth. Hypersensitivity can also occur following the placement of a filling. Heraeus Kulzer has therefore added a special desensitizer to products in its adhesive range. This means that the German dental manufacturer provides the perfect adhesive for all indications with an added desensitizing effect. The desensitizer reacts interdentinally, does not form a surface film and therefore reduces pain effectively without impairing the bonding strength.

Application with Heraeus Kulzer adhesives

No matter, which type of adhesive is preferred, the desensitizer is applied in conjunction with the different Heraeus Kulzer bonding agents – according to all particular requirements and demands:

- **iBond** is a 7th generation self-etching adhesive. Etching, priming, bonding and desensitization are completed in a single step – without mixing. This all-in-one solution is better tolerated by the patient and rationalizes the procedure at the chairside.
- **Gluma Comfort Bond + Desensitizer** is a one-bottle adhesive that primes, bonds and desensitizes in one step indicated for all direct and indirect restorations.

Press Release
Bunnteilung

- When using **Gluma Solid Bond**, the multi-bottle adhesive system of Heraeus Kulzer, **Gluma Desensitizer** can be applied separately after etching to reduce hypersensitivity.
